"Determination Of The Probabilities Of Error Of The First And Second Type During Truncated-Sequential Analysis"

Radiotekhnika, Vol 27, No 4, Apr 1972, pp 12-16

Abstract: In problems of the acquisition of the signals of radar systems, the number of observations n (sample size) is limited from above by the assigned time of acquisition. For acceptance of a solution concerning the application of a truncated-sequential analysis instead of other acquisition criteria it is necessary to know the probability of error of the first α and second β type. A method is proposed for determining the precise magnitudes of such errors during truncated-sequential analysis, for random magnitudes with binary distribution. 2 ill. 5 ref. Received, 1 Dec 69.

"Some Problems in Commercial Fishing Bioacoustics"

Moscow, Rybnoye Khozyaystvo, No 9, 1971, pp 35-38

Abstract: Since the acoustic method of catching pelagic fish is becoming increasingly more popular, it should be expounded on a more scientific basis to yield better results. The few available recordings of the sounds and noises produced by fishes display an almost infinite number of large differences and small but highly significant nuances in the intervals between individual impulses, their spectral components, and specific modulation of intensity. Reproducing these characteristics by electronic equipment seems impossible. An easier and more precise method is to duplicate original recordings. These must be done on highly sensitive instruments, with simultaneous observation and subsequent verification of the responses they induce. Frequently, quite different sound produce the same reaction. For example, before attacking, anchovies, mackerels, or herrings, dolphins emit intense whistling sounds which cause the smaller fishes to flock together into a compact mass that becomes easy prey for the dolphins. Whispering sounds

1/2

KUZNETSOV, YU. A., Rybnoye Khozyaystvo, No 9, 1971, pp 35-38

emitted by herrings in the face of approaching danger also causes all the herrings of the school to flock together into a dense mass. On the other hand, a distant sound occasionally produces a different response than a nearby one. Some replay instruments have a strong vibration of their own which distorts the sound and ruins the effect; all such interference must be eliminated. Frequently, the use of simple mechanical devices is quite successful. For example, air-filled bladders equipped with various reeds or screens at the air opening fairly accurately imitate some sounds emitted by dolphins and other fishes. Similarly, Japanese fishers get good results by showering the fishing ground with "artificial rain" which imitates the splashing of small fishes on the surface of the ocean and lures tuna to the ships.

"Avalanche-Drift Diode With a Heterojunction"

Leningrad, Fizika i tekhnika poluprovodnikov, vol. 5, No. 8, 1971,
pp 1671-1672

Abstract: In the course of work on avalanche-drift diodes with heterojunctions of Ge-GaAs, specimens were obtained in which the generation of UHF oscillations was observed. Heterojunctions with a p-n-n⁺ structure were obtained by growing layers of p-type germanium alloyed with gallium, the layer thickness being 7 microns, with an acceptor impurity of about $1 \cdot 10^{16}/\text{cm}^3$, on n-type GaAs epitaxial film, 6 microns thick with a donor impurity concentration of about $6 \cdot 10^{15}/\text{cm}^3$, grown on an n substrate with a resistivity of 0.001 ohm cm. The power supplied to the load in the oscillations amounted to 40-120 mw per pulse at a frequency of 11 GHz. The volt-ampere characteristic of an AV-15 diode, belonging to this class of device, is given. The authors are associated with the Moscow Steel and Alloy Institute.

"Recording the Oscillation Plane Angle of Linearly Polarized Infrared Radiation"

Leningrad, Optiko-Mekhanicheskaya Promyshlennost', No 8, August 1970, pp 30-33

Abstract: An efficient, compact Faraday modulator has been developed, with a ferrite-garnet magneto-optical element. On the basis of this modulator has been constructed a highly sensitive polarization unit which permits an angle to be recorded with an accuracy of 0.0002 degree. An analysis is made of the relationship of the sensitivity to the parameters of the optical system and the modulator. 3 figures, 9 bibliographic entries.

90914q Initiation of the polymerization of some vinyl monomers by aqueous solutions of vinylene carbonate. Kuznetsov, Yu. A.; Golenishcheva, S. A.; Klubikova, L. E.; Klimov, V. N. Zn. Prikl. Khim. (Leningrad) 1970, 43(1), 111-4 (Russ.).
CH₂:CHCONH₂ (Ia), MeCH:CHCO₂H (Ib), CH₂:CHCN, CH₂:CHOAc (Ic), and PhCH:CH₂ were polymerized at 20-80° in H₂O in the presence of vinylene carbonate (II) and O₂. The highest yields of polymer (92-5%) were obtained when the monomer and polymer were completely H₂O-sol. (Ia and Ib). Increasing the temp. shortened the induction period due to acceleration of hydrolysis, but the intrinsic viscosity (η) of the polymer decreased. It was preferable to decrease the induction period by introduction of the initiator (aq. II) after prior treatment at 50-10° for 1-2 hr. This treatment decreased the induction period in the polymer, of Ic at 20° to ≤ 10-20 min. (compared with 5-6 hr), and did not decrease η . A 1% aq. soln. of I preserved its initiating ability for > 12 days. Introduction of hydroscopic agents such as

LO

AP0048787

EtOH and dioxane, and increasing the vol. of the aq. phase to a I-H₂O ratio > 1:5 in the homopolymer, of I did not increase the poly(vinylene carbonate) (II) yield. Hydrolysis products of I, viz., HOCH₂CHO (III) and HCO₂H accumulated during polymer. Increasing the amt. of HCO₂H in the starting soln. lowered the yield of II and its v. only when substantial amounts were added, apparently due to increased hydrolysis at lower pH. III had no effect on I polymer. The yield of II was ≤ 40% after 48 hr.

"A Differentiating Accelerometer for Linear Acceleration"

Leningrad, Priborostroyeniye, Vol 16, No 5, 1973, pp 95-100

Abstract: The accelerometer consists of a fluid-filled casing, an inertial body connected to the casing by springs, a power transformer with windings on the inertial body, and a movable induction displacement transformer. The fixed portion of this last transformer is attached to the casing. The ends of the inertial body have cylindrical recesses containing the pole pieces and magnets of the force magnetic transformer system. With an external amplifier, the transformers form an electric spring. A channel through the center of the inertial body contains a neutral buoyancy float connected to the casing by springs and carrying the movable part of a displacement induction transformer, the other part of which is connected to the body, and the coil of a force electric spring transformer. Under acceleration, the displacement of the inertial body is proportional to the acceleration, while the pressure difference between the fluid reservoirs ahead and behind the inertial body is proportional to the speed of movement of the inertial body and therefore to the first derivative of the acceleration. The displacement of the float is

Raschet. Konstruktsiy Silos. Sooruzh. [Design of Silo Structures -- Collection of Works], Kiev, Budivel'nik Press, 1972, pp 55-66, (Translated from Referativnyy Zhurnal, Mekhanika, No 10, 1972, Abstract No 10 V1026, by the author's).

Translation: The process of rupture of reinforced concrete bent elements under sign-changing loads in a symmetrical cycle is studied with low frequencies (0.015 and 0.020 Hz) and fixed amplitudes of deformations and stresses. A unique form of rupture of these elements is discovered, requiring new theoretical concepts for its explanation. In particular, the creep theory of concrete is required. The dependence of endurance on frequency is established, decreasing with increasing period of oscillations. An experimental installation and methods of performing experiments are described. The analysis of norm documents and literature data presented in the work confirms the necessity of refining a number of coefficients used to design the structures for sign-changing loads. The results of the work can be used to calculate structures subjected to variable loadings at low frequencies, such as the supports of rotating furnaces, silo walls, etc. The work con-

Accelerometers

A DIFFERENTIATING LINEAR ACCELEROMETER

UDC 62-338

C 621

SO: JPRS 59140
G A46 713

(17)

24 November 1972, pp. 91-101

In this article a diagram of an accelerometer is considered, which makes it possible to obtain the first derivative of the linear acceleration by direct measurement. The operating principle of the instrument is demonstrated. Differential equations of motions and transfer functions of the instrument are obtained, which may be used in the selection of its parameters.

In a number of cases in stabilization and control systems, and also in dynamic investigations of the behavior of an object, an instrument transmitting a signal that is proportional to the first derivative of the linear acceleration is needed. In particular, a need for such an instrument arises in the formation of controlling signals in gyroscopes with electromagnetic control [1]. The instrument under consideration [2] is able from transmitting an acceleration signal, also transmits the signal of the first derivative of linear acceleration.

The accelerometer (Figure 1) contains a casting 1 filled with a fluid. The inertial body 2, in which are located the windings 3 of the power magnetoelectric converter and the moving part 7 of the inductive transfer converter are placed, is connected with the casting 1 by elastic elements 8. The fixed part 10 of the inductive transfer converter is fastened in the casting of the instrument. At the end of the inertial body 2 cylindrical pole pieces are made, in which the pole ends 4 are placed and also the magnets 5 of the magnetic system of the power magnetoelectric converter.

XIV. INDEX OF SUBSTANCES INFLUENCING THE GROWTH AND REPRODUCTION OF WATERSIDE WATERLILIES.

Institute for International Economic Policy, Washington, D.C., International Monetary Fund, Washington, D.C., June 1977, p. 193.

Another interpretation of the defects in the β -phase is that of ballistic artefacts due to the motion of plastic dislocations. It has been shown by several authors¹⁻³ that the effects of ballistic artefacts observed in the methods of electron microscopy are effects of scattering, diffraction and dislocation when density, ρ , creates local fields which are introduced into the initial wavefunction intensities, and the effect of the defects introduced into the wavefunction are the structural imperfections of the crystal. It is shown that in our experiments the effects of the plastic artefacts observed in the sections of carbonized epilayers were removed. It was demonstrated that in the β -phase artefacts due to the motion of carbonized epilayers with density of $\rho = 10^{17}$ cm⁻³ were detected, and a high density of the plastic defects was obtained. The method of transmission electron microscopy was used to obtain high resolution sections that detect mainly the surface imperfections in the β -phase. The method of transmission electron microscopy was used to obtain high resolution sections that detect mainly the surface imperfections in the β -phase.

In the epitaxial layers obtained by liquid epitaxy, small dislocations were observed however, no increased defect density caused by the pallium. In these structures, the absence of defects, the enhanced defects in the epilayers are observed, probably arises from the fact that at the initial stage in epitaxial growth, the liquid pallium takes place to nucleation of the substrate material for the liquid pallium depth exceeding the depth of the disturbed layer.

Tr. Mosk. in-ta radiotekhn., elektron. i avtomatiki (Works of the Moscow Institute of Radio Engineering, Electronics and Automation), 1970, vyp. 10, pp 85-95 (from RZh-Radiotekhnika, No 1, Jan 71, Abstract No 14213)

Translation: Hypotheses are presented on the nature of the possible signals from extraterrestrial civilizations. Since the correspondent cannot know the parameters of the signal being received, the signal structure must ensure adequate ease for establishing an artificial origin and for signal decoding. From the viewpoint of signal decoding and understanding messages, it is preferable to transmit visual images with scanning by signal parameters. Use of the radio band is most probable; therefore the possibility of signal reception from extraterrestrial civilizations should be taken into account when developing radio astronomical equipment. Existing facilities do not allow for such reception. Two illustrations. Bibliography of five titles. N. S.

"Concerning the Part Played by Ion Exchange in Precipitation of Radium From Sea Water"

Leningrad, Radiokhimiya, Vol 14, No 3, 1972, pp 441-446

Abstract: An investigation was undertaken to determine the extent to which ion exchange is responsible for the accumulation of ^{226}Ra in sediment. Simultaneous direct determinations were made of the absolute concentrations of ^{226}Ra in samples of bottom sediments taken from the Southern and Central sections of the Indian Ocean and from the equatorial section of the Pacific Ocean. The cation-exchange capacity of the same specimens was determined by two independent methods. Analysis of the results shows a direct relationship between cation-exchange capacity of ocean sediments and the ^{226}Ra concentration in these sediments.

"Measuring the Load Voltage Standing Wave Ratio in a Broad Frequency Range by the Frequency Variation Method"

Tr. Leningr. in-ta tochnoy mekh. i optiki (Works of the Leningrad Institute of Precision Mechanics and Optics), 1970, vyp. 69, pp 103-111 (from RZh-Radiotekhnika, No 4, Apr 71, Abstract No 4A308)

Translation: The deficiencies of the measuring line method used for experimental study of wide-band loads are noted. The frequency variation method presents the possibility of creating a device permitting visual observation of the matching characteristics in the entire operating frequency band. The essence of this method consists in the fact that when measuring the voltage standing wave ratio the phase of the field under the measuring probe is varied by smooth rocking of the oscillator frequency which is equivalent to smooth variation of the electric length of the line with constant physical length of it. The procedure for measuring the voltage standing wave ratio is described, and the experimental results regarding errors are presented.

13312q Measurement of the permittivity of films. [Russian] Sov. Vn. N. (USSR). Izmer. Tekh. 1969, (8), 56. A (Russia). This method was developed for detg. permittivity (ϵ) of thin polymeric films. The proposed method consists of positioning the film surface in the direction parallel to the direction of the applied electromagnetic sinusoidal field. Thus only the length and not the thickness of the sample limit the detn. accuracy. First the wavelength of a stationary electromagnetic field in the absence of a sample is detd. with an oscilloscope. Second a film is inserted and the wavelength detd. again. From the values of these wavelengths ϵ is calcd. Exptl. detn. of ϵ values of polyethylene, poly(Me methacrylate), or Getinaks (insulation) paper dipped in phenol-aldehyde resin and cured by compression by the method gave good agreement with other methods. "Interaction of the Oxochlorides of Molybdenum (VI) and Tungsten (VI) with
Methylphosphonic Acid"

Moscow, Zhurnal Neorganicheskoy Khimii, Vol 18, No 5, May 73, pp 1255-1259

Abstract: By the interaction of MoO_2Cl_2 and WO_2Cl_2 with methylphosphonic acid MeP(O)(OH)_2 , compounds with the composition $\text{MO}_2\text{ClOP(O)(Me)OH}$ (I), $\text{MO}_2\text{OP(O)(Me)OH}/_2$ (II), and $\text{MO}_2\text{O}_2\text{P(O)(Me)}$ (III) were prepared, where M = Mo, W. Pyrolysis of the acidic salts II at 200° led to the pyroalts $\text{MO}_2/\text{OP(O)(Me)}/_2\text{O}$ (IV). IR spectroscopy indicated that II and III were polymers with MOMOM linkages, similarly to the initial oxochlorides, while IV contained isolated MO groups and also POP groups that were absent in II and III. III and IV apparently contained phosphonate links. Structural formulas for II, III, and IV are proposed (figure).

"Structural Studies of the Oxomolybdenum (V) Phosphinate Complexes by the
EPR Method"

Moscow, Zhurnal Neorganicheskoy Khimii, Vol 18, No 7, Jul. 73, pp 1819-1823

Abstract: The structures of oxomolybdenum (V) phosphinate complexes $\text{MoO}(\text{DPP})_3$, $\text{MoOCl}(\text{DPP})_2$ and MoOCl_2DPP , where DPP = $\text{Ph}_2\text{P}(\text{O})\text{O}^-$ were studied in benzene, chloroform and methylene chloride solutions. The g-factors were determined for these complexes. It has been shown that these complexes have a very labile equilibrium. Addition of HCl to the solution of $\text{MoO}(\text{DPP})_3$ shifts the equilibrium towards the formation of chlorine containing complexes, all the way to the formation of MoOCl_4^- . Dissolving the complex $\text{MoOCl}(\text{DPP})_2$ in chloroform is accompanied by the formation of several complexes due to redistribution of the ligands, among which the $\text{MoO}(\text{DPP})_3$ and MoOCl_2DPP are the most stable ones.

"Polyphosphonates of Chalcophosphorus (V)"

Moscow, Zhurnal Neorganicheskoy Khimii, Vol. 17, No. 2, Part 2, pp. 448-452, 1972

Abstract: Upon reaction of MoCl_5 with digemethylphosphinic acid $\text{H}_2\text{P}(\text{OEt})_2$, oligophosphonates of chalcophosphorus with the composition $\text{Mo}(\text{OEt})_2(\text{P}(\text{OEt})_2)_n$ (I , II , III) and $\text{MoOCl}(\text{P}(\text{OEt})_2)_2$ (IV) formed, which had the structure of poly- and triphosphonates with phosphonate bridges and indirect polyphosphorus-oxygen bonds. On reduction with LiAlH_4 , I and II were converted into the dimercaptochalcophosphorus phosphonate keto, $(\text{H}_2\text{S})_2\text{Mo}(\text{OEt})_2(\text{P}(\text{OEt})_2)_n$ (V). I reacted with LiOH more readily than III . With an increase in degree of displacement of phosphate groups with Cl atoms (I vs. II) and/or Cl with O atoms (II vs. I), the degree of polymerization of the phosphonate in HClO_4 solutions increased.

"Tungsten Analog of Phosphonitrile Chloride and Some of Its Properties"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Khimicheskaya, No 2, Feb 70, pp 463-465

Abstract: The authors undertook to synthesize the tungsten analog of phosphonitrile chloride and to study reactions of this compound with diethylamine, liquid ammonia, water and ethanol. The procedure used for the synthesis of tungsten nitrile chloride was similar to that used previously for the preparation of NbNCl_2 and TaNCl_2 . The resultant tungsten analog was of the composition WNCl_2 . The IR spectrum of WNCl_2 reveals a wide absorption band in the $1000\text{-}500 \text{ cm}^{-1}$ region, indicating the presence of "endless" chains $-\text{WNWNWN}-$ in the compound.

"Ways of Slowing Protein Catabolism in Burns"

Moscow, Sovetskaya Meditsina, No 1, 1973, pp 33-36

Abstract: Contrical, an East German drug known to inhibit trypsin, chymotrypsin, plasmin, and kallidinogenase, was administered to 28 patients with extensive thermal burns, all of whom were suffering from hypoproteinemia, hypoalbuminemia, and elevated globulin levels at the initiation of contrical treatment. The drug prevented the continued decrease in serum proteins, especially albumins, characteristic of the early period of burns. Two to 3 days after the burn the activity of the proteolytic enzymes increased markedly along with the development of hypo- and dysproteinemia. Contrical was suspended after 7 days but proteolytic activity began to decrease and continued to do so for 7 more days. At this time the patients exhibited a tendency toward hyperexcretion of nitrogen (urea nitrogen) and sharp increase in excretion of creatinine. Thus, contrical would seem to be efficacious in inhibiting the breakdown of tissue and serum proteins that normally occurs in burns.

"Effects of the Rate and Temperature of Straining on the Structure and
Properties of the Alloy Mo-0.5% Ti"

Moscow, Metallovedeniye, No 6, 1971, pp 50-53

Abstract: Effects of the rate and temperature of straining on the structure and properties of the molybdenum alloy Mo-0.5% Ti were investigated on specimens strained at speeds of 0.2, 5.0, and 20 m/sec on the KB62B hot stamping press (630 tons), the M211 exhaust stamping hammer, and the TM-39 high-frequency unit, respectively. The investigation results demonstrate a high plasticity of the alloy Mo-0.5% Ti both in the recrystallized and strained conditions. A high-rate straining significantly increases the plasticity in the working process. Macrostructures of specimens upset at 600-1200°C at high and low speeds show deadlocks. Sectional hardness changes of specimens upset with 70% of strain by 900°C were by 0.2 m/sec strain rate HV 195-266 and by 20 m/sec strain rate HV 212-333. For an optimum strength and plasticity correlation, a cellular structure must be produced in the ingot with not less than 70% of strain at a temperature which is lower than the recrystallization temperature under conditions excluding a heat effect. Six figures, one table, six bibliographic references.

THE DIAGNOSTIC SIGNIFICANCE OF THE DEFECT IN THE VISUAL FIELD
IN HEMORRHAGES INTO THE SUBARACHNOID SPACE

A. S. Kuznetsova

Among the 630 patients with hemorrhages into the subarachnoid space 14 patients displayed stable changes in the visual field, which constituted 2.2% of the cases. In 11 of the 14 cases there was homonymous hemianopsia which developed in hemorrhages from different vascular areas. A more certain localization of the source of hemorrhage in such cases must be established with the consideration of the focal symptomatology in each individual case. It is the authoress experience that a combination of homonymous hemianopsia with paresis of the oculomotor nerve is characteristic for hemorrhages from the supracerebral aneurysm of the internal carotid artery. In combinations with aphasic disorders it may be assumed that the hemorrhage occurred from the radicle branches of middle cerebral artery. In an isolated hemianopsia without affections of the cranial nerve innervation and hemiparesis, or combinations with cerebellar changes, the foci of hemorrhages are located in the area of the posterior cerebral artery. A full loss of sight in the acute period of the disease is unfavorable in relation to restitution of sight and most likely is conditioned by hemorrhages from the anterior communicating artery.

"Acute Febrile Diseases in Children Caused by Mixed Enterovirus and Adenovirus
Infection"

Moscow, Voprosy Virusologii, No 5, 1971, pp 624-625

Abstract: Hospitalized children convalescing from dysentery (*Sh. sonnei*) developed a disease of focal character. Virological and serological studies revealed the participation of two viral agents -- adenovirus and ECHO-1 virus. The clinical picture included the syndrome of serous meningitis in some cases and symptoms of respiratory infection in others. In some children, it was impossible to tell from the clinical symptoms which pathogen was more significant. In a few cases, the viral infection exacerbated the dysentery. Thus, an isolated group of children recovering from dysentery (*Sh. sonnei*) experienced an outbreak of diseases with heterogeneous clinical symptoms caused by ECHO-1 virus and adenovirus type 3.

"Virological, Clinical and Immunological Characterization of Hong Kong A2
Influenza in Children"

Moscow, Voprosy Virusologii, No 4, Jul/Aug 71, p 492

Translation: The 1969 influenza outbreak in Leningrad was caused by a new antigenic strain of influenza virus of sero type A2 (Hong Kong). During the outbreak, tests were performed on chick embryos infected with materials collected from 53 patients with sporadic forms of the disease, with eight samples collected from foci, and with 10 samples collected from children who had died of influenza. Twenty-three hemagglutinating agents were isolated and identified as A2 Hong Kong influenza viruses. All strains were sensitive to inhibitors. Serological investigation of paired sera of 388 persons revealed that specific immunological shifts took place in children fairly early. Positive shifts occurred in 40.2% of children aged up to 1 year, which considerably exceeded analogous shifts in a similar group of children in previous years. The express method of immunofluorescent analysis of nose and throat smears yielded positive 1/2

"Radiative-Conductive Heat Exchange in a Plane Layer of a Selectively Absorbing Medium"

Moscow, Izv. AN SSSR: Energetika i Transport, No 3, May/Jun 72, pp 161-164

Abstract: An approach is considered for formulating problems of one-dimensional radiative-conductive heat exchange in a selectively absorbing medium. It is shown that the Newton method can be used for computer solution of heat-transfer problems of this type over a wide range of layer thicknesses and Stark numbers. Numerical data are presented for such problems in carbon dioxide and methyl methacrylate. It is found that the temperature field in a layer of carbon dioxide (a medium with a broad transmission spectrum) is qualitatively similar to that in a gray medium. When the transmission region is spectrally localized (as in methyl methacrylate), the temperature distribution in the layer is appreciably dependent on the temperature level of the heating surface.

FEATURES TO PECULIAR GLOBAL CESIUM-137
AND STRONTIUM-90 REACHING THE POPULATION
OF POLEZIA BY DIFFERENT FOOD SUPPLY ROUTES

A. N. Marey, R. M. Barkhudarov, V. K. Chumak, E. V. Petukhova,
E. B. Tyurukhanova, O. A. Kurnelova, N. V. Noglikova,
S. B. Pozhitilova, D. V. Slobodtchikov

The paper presents investigation data on the order of passage of abovementioned isotopes from the soil into food products with due regard for the soil nature and the accumulation of isotopes in the human body. The finding was that the extent of the passage of cesium-137 from the soil into food products fluctuated considerably and depended on the type of soil. Thus, in a soil consisting mainly of a sand fraction the passage of cesium-137 was more pronounced. Similar observations were made in respect to all of the objects examined. However, no differences in the migration of strontium-90 could be detected. Due to the high passage of cesium-137 into food products its content in the human body was high as well.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. SEVERAL WAYS OF REMOVING UNDESIRED ELEMENTS FROM SULFAMATE ELECTROLYTES PRIOR TO THEIR ELECTROLYSIS IN THE PRODUCTION OF HIGHLY PURE PB WERE EXAMD. THE ION EXCHANGE METHOD WAS NOT FEASIBLE, DUE TO LACK OF A SELECTIVE RESIN CAPABLE OF REMOVING THE CONTAMINATING IONS (SMALLER THAN 0.1 MG-L.) EFFECTIVELY AT VERY HIGH CONCNS. OF PB (120 GL.). WHEN THE SOLNS WERE CONTACTED WITH PB SPONGE AND CU AND ONLY 10-20PERCENT OF THE AS AND SD WERE REMOVED. HOWEVER, PB CONTG. SIMILAR TO 1 TIMES 10 PRIME NEGATIVES PERCENT IF EACH OF THESE IMPURITIES COULD BE MADE FROM THUS PURIFIED SOLNS. BETTER RESULTS WERE OBTAINED BY METHODS BASED ON ADSORPTION OR HYDROLYSIS AND SUBSEQUENT ADSORPTION. GROUND ACTIVATED CARBON (TRADE NAME "KAD") WAS THE MOST EFFECTIVE ADSORBENT. EXTREMELY PURE PB (99.99991-99.99999PERCENT) WAS MADE FROM SULFAMATE SOLNS, WHOSE PH WAS FIRST ADJUSTED TO 4-5 BY ADDN. OF PBCO SUB3. THEN THE SOLNS WERE PURIFIED BY 2 STAGE COUNTERCURRENT CONTACT WITH ACTIVATED C (65 G-LL) AT 20-35DEGREES FOR 30 MIN. THE INITIAL AND FINAL CONCNS. (10 PRIME NEGATIVES MG-L.) OF THE CONTAMINANTS WERE: AG 72.5-0, CU 123.0-0.09, AS 49.8-0.5, SD 126.0-0.4, SN 176.0-5.5, AND IN 56.0-0.3, RESP.

"Degree of Indifference of a Conditioned Stimulus: Light Self-Stimulation"
Moscow, Doklady Akademii Nauk SSSR, No 4, 1971, pp 978-980

Abstract: Rats were placed in a chamber in one wall of which was a pedal that produced a flash of light when pressed. After a few attempts the animals repeatedly pressed the pedal from 20 to 150 times an hour and between flashes they would lie on or near the pedal. When the light was disconnected, the animals ceased to press the pedal and would occupy various parts of the chamber. Intraperitoneal injection of amphetamine sulfate stimulated the animals and at first resulted in their pressing the pedal somewhat less often than usual. But 5 to 20 minutes later the rate of self-stimulation increased sharply and sometimes 20 or more times greater than the original level. Thus light, like electric current, is not a neutral stimulus. In another series of experiments, rats were given the choice of two chambers in a labyrinth, one containing a blinking light. Most of the animals displayed a clear-cut preference for the illuminated chamber until the frequency of flashes was increased to 20 per sec, whereupon all the animals immediately left the chamber.

"Parametric Instability of an Electron Beam Modulated by an External Elec-
trostatic Field"

Leningrad, Zhurnal Tekhnicheskoy Fiziki, Vol 42, No 11, Nov 72, pp 2264-2271

Abstract: The paper presents the results of experiments on studying the instability of an electron beam passing through a spatially periodic electric field. The conditions of existence of instability are experimentally determined. The increment of instability is measured together with its dependence on the electric field. The energy distributions of the electrons in the beam are measured in various operating modes. Some nonlinear limitations of stability are observed. The results agree with the theoretical model of parametric instability. The authors thank A. P. Vorozin for preparing the experiment and assisting with the measurements.

Republic Interdepartmental Collection), 1972, No. 3, pp 202-208 (from
RZh-Fizika, No 11, Nov 72, Abstract No 11G248)

Translation: Experimental studies of parametric instability of an electron beam as it passes through a spatially periodic electric field are described. The functional relationship between the level of the high-frequency radiation and the accelerating voltage and the current of the gun and also the magnitude of the external electric field is investigated. It was established that these relationships have a resonance character. Theoretical and experimental results for the case of resonance at the second harmonic of the plasma frequency of the beam agree quite satisfactorily. The results are analyzed.

"Effect of Ionizing Radiation on the Properties of Fluorine-containing Copolymer Latex"

Moscow, Kolloidnyy Zhurnal, Vol 33, No 5, Sep-Oct 71, pp 690-692

Abstract: The effect of ionizing radiation on the properties of fluorine-containing copolymer latex was studied by using Co^{60} as a source, the radiation dose ranging from 0.25 to 50 Mrad. The pH of the irradiated copolymer latex became lower, as did the resistance to electrolytes. After irradiation the coagulation threshold of the latex was also lowered with simultaneous coagulation of globules and intraglobular crosslinking of the polymer. Increased radiation dose resulted in greater three-dimensional lattice density. Irradiation of the latex does not lead to formation of intraglobular chemical bonds and to better film formation.

"Effect of Ultrasonic Vibrations on Mechanical Properties and
Fine Structure of 12Kh1MF Steel"

Moscow, Metallovedeniye i Termicheskaya Obrabotka Metallov, No 8,
1971, pp 67-68

Abstract: A study was made of the aging of 12Kh1MF steel (0.11%
C, 0.20% Si, 0.40% Mn, 1.12% Cr, 0.20% Ni, 0.27% Mo, 0.22% V)
under the action of ultrasonic vibrations. Billets were normalized
at 980° C and tempered at 740° C. Ultrasound-induced
changes in properties were compared with changes in the same
properties as a result of thermal aging without stress. A com-
parison was made of fine structure, short-time mechanical proper-
ties, the content of carbide-forming elements (chromium, molyb-
denum, vanadium) in the anode deposit and the time until failure

at $\sigma = 16 \text{ kg/mm}^2$ and 555°C . The results indicate that the processes occurring in 12Kh1MF steel as a result of the action of 20 kHz ultrasonic vibrations correspond to the processes taking place during thermal aging without stress, but that they occur at a much more rapid rate. Ultrasonic vibrations with a certain peak pressure can be used for accelerated long-time strength testing of 12Kh1MF-type steels.

"A Disease of Winter Wheat"

Moscow, Zashchita Rasteniy, No 2, Feb 73, p 49

Abstract: In some rayons of Odessa Oblast' and in the northwest of the Moldavian SSR, a disease of winter wheat was recorded in 1971 which affected on the average 30% (a maximum of 60%) of the wheat ears. On some farms the disease caused a loss of up to 1/3 of the harvest. An investigation of infected wheat of the variety Bezostaya 1 showed that the grain was generally (to 82%) puny and was infected with fusariosis to 8.2%. *F. graminearum*, *F. avenaceum*, and *F. solani* were isolated from the infected grain. Saprophytic microflora (*Alternaria* and *Penicillium*) predominated on the scales of the grain. *F. graminearum* and sterile *Fusarium* forms were also isolated from the scales. *F. avenaceum*, *F. solani*, and *Ophiobolus graminis* were present in the discolored stalks and in the root nodes. Above-normal precipitation and high temperatures during the formation of the ears and grain ripening contributed to the outbreak of the disease.

"All-Union Conference on Smut"

Moscow, Zashchita Rasteniy, No 5, 1971, pp 48-50

Abstract: Although some progress has been made in recent years in controlling fungus diseases, the problem remains a severe one in most regions of the USSR. The reasons for the prevalence of wheat infections and other fungus diseases include inadequate treatment of seeds, failure to keep aged plots isolated, reluctance to plant spring wheat late in the fall, and failure to use resistant varieties. An All-Union Conference held last February in Leningrad under the sponsorship of the Ministry of Health USSR indicates the concern shown by the authorities at the continuing heavy crop losses caused by smut. Papers were presented on the value of thermal and chemical methods of disinfecting seeds, modern agricultural practices, and the possibility of centralized treatment of seeds. Several reports dealt with systemic fungicides that not only have a disinfecting action on the agents of various diseases, but possess immunizing properties as well, e.g., rodan, vitavax, and bonlite.

"Radioprotective Properties of Bis(2-Aminoethyl) Disulfide Dihydrobromide
in the Longwave Band of X-Ray Irradiation"

Moscow, Meditsinskaya Radiologiya, Vol 15, No 12, 1970, pp 7-11

Abstract: The dose decrease factor (DDF) of the radioprotector bis(2-aminoethyl) disulfide dihydrobromide was determined using as a test the induction of prophage development in lysogenic bacteria. Suspensions of a 4-hour bacterial culture of *E. coli* K-12 (Λ) in physiological saline were exposed to x-rays (100 to 300 r) with an effective energy of 35.7 kev. All doses of the radioprotector used (0.01, 0.005, 0.001 M) markedly reduced the yield of phage particles in the irradiated lysogenic culture. The mean value of the DDF for the 0.005 M concentration (derived from 4 experiments) was 2.1 ± 0.94 . This value remained constant within the limits of experimental error in the entire range of irradiation doses. Another series of experiments showed that the DDF for longwave x-ray irradiation in the energy region of 10.3 to 35.7 kev is independent of the effective energy.

"Improvement of Mechanical Properties of Hot-Rolled 10KhEND Steel"

Moscow, Metallurg, No 1, Jan 73, pp 16-17

Abstract: Experimental data are presented on the effects of chemical composition, method of final deoxidation, and temperature at the end of rolling on the level of mechanical properties and the amount of waste of 10KhEND steel in the hot-rolled state. The effects of C, Mn, Si, and Cr and their cummulative effect on the impact strength and the ultimate strength (yield) of 10KhEND steel deoxidized in the ladle with aluminum (1000 g/ton) and ferrotitanium (500 g/ton) are discussed by reference to diagrams. Best results in improving the mechanical properties and in decreasing the amount of waste were obtained by applying calciosilicate at (2000 g/ton) and by reducing the rolling temperature to 900°C at the same time. The use of calciosilicate in the final deoxidation of steel in the open-hearth shop of the Plant imeni Dzerzhinskii decreased the amount of waste by 5-5.5 times. Two figures, one table.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE ADSORPTION OF 2,4,DINITROPHENYL HYDRAZONES OF ACETONE (2,4,DNPHA) AND METHYLPROPYLKETONE (2,4,DNPH MPK) HAS BEEN STUDIED ON GRAPHITIZED CHANNEL BLACK FROM SOLUTIONS IN C SUB2 H SUB5 OH AND CCL SUB4 AT 0, 20 AND 40DEGREES. FROM THE COMPARISON OF THE ADSORPTION ISOTHERMS OF THESE SUBSTANCES AND OF 2,4,DINITROPHENYL HYDRAZONE OF METHYLETHYLKETONE (2,4,DNPH MEK) STUDIED EARLIER IT HAS BEEN CONCLUDED THAT HORIZONTAL SECTIONS OF ISOTHERMS OR INFLECTION POINTS CORRESPOND TO LOOSER PACKING OF MOLECULES OF 2,4,DNPHA AND 2,4,DNPH MPK AS COMPARED TO 2,4,DNPH MEK. THIS VARIATION OF THE ADSORPTION CHARACTERISTICS FOLLOWS THAT OF THE MELTING POINTS AND SOLUBILITIES OF HYDRAZONES IN C SUB2 H SUB5 OH AND CCL SUB4. COMPARISON OF THE ISOTERIC ADSORPTION HEATS OF THE HYDRAZONES STUDIES (4-9 KCAL-MOLE) SHOWS THAT THEIR DECREASE WHEN PASSING FROM C SUB2 H SUB5 OH TO CCL SUB4 IS DUE TO INCREASING COMPETITION OF THE SOLVENT.

"Comparative Study of the Adsorption of 2,4-Dinitrophenylhydrazones on Graphitized Carbon Black from Solutions"

Moscow, Kolloidnyy Zhurnal, Vol 32, No 3, May-Jun 1970, pp 354-359

Abstract: The adsorption of acetone 2,4-dinitrophenylhydrazone (I) and methylpropylketone 2,4-dinitrophenylhydrazone (II) on graphitized channel black from EtOH and CCl₄ solutions at 0, 20, and 40° was studied. Comparison of the area per adsorbed molecule of I and II in dense monolayers with that for methylethylketone 2,4-dinitrophenylhydrazone (III), the adsorption of which had been investigated earlier, showed that the packing of molecules was looser for I and II than for III. The adsorption increased with decreasing solubilities, which diminished in the order III>I>II for either solvent, and were greater for all three substances in EtOH than in CCl₄. The adsorption characteristics were also related to the melting points of the substances, which were 116, 126, and 145° for III, I, and II, respectively. For every hydrazone studied, the heat of 1/2

USSR

VORONTSOV, V. V., et al, Kolloidnyy Zhurnal, Vol 32, No 3, May-Jun 1970, pp 354-359

adsorption decreased on transition from an EtOH solution to one in CCl_4 . This was due to a corresponding difference in the capacity of molecules of the solvent to compete in adsorption with those of the hydrazones. The authors thank YU. S. SHABAROV for synthesizing the 2,4-dinitrophenylhydrazones.
